## Going probabilistic

---

## Systems can get very complex

- E.g., 5 components, 3 possible traces each
- No communication (pure interleaving)
- Many permutations

## Systems can get very complex

- E.g., 5 components, 3 possible traces each
- No communication (pure interleaving)
- Many permutations
- More components, more traces – untreatable

## Systems can get very complex

- E.g., 5 components, 3 possible traces each
- No communication (pure interleaving)
- Many permutations
- More components, more traces – untreatable
- Verifying deadlock freedom (and others) requires traversing all states
- **Approximation:**
  - traverse only part of the states
  - give more **priority** to some actions
  - return (statistically) likelihood of a given property

- $\alpha : S \rightarrow N \times S$  Moore machine
- $\alpha : S \rightarrow \text{Bool} \times S^N$  deterministic automata
- $\alpha : S \rightarrow \text{Bool} \times P(S)^N$  non-deterministic automata (reactive)
- $\alpha : S \rightarrow P(N \times S)$  non deterministic LTS (generative)
- $\alpha : S \rightarrow (S + 1)^N$  partial deterministic LTS
- $\alpha : S \rightarrow P(S)$  unlabelled TS
- $\alpha : S \rightarrow D(S)$  Markov chain

## Markov chains

$$\alpha : S \rightarrow D(S)$$

where  $D(S)$  is the set of all **discrete probability distributions** on set  $S$

A Markov chain goes from a state  $s$  to a state  $s'$  with probability  $p$  if

$$\alpha(s) = \mu \quad \text{with} \quad \mu(s') = p > 0$$

## Recall

$\mu : S \rightarrow [0, 1]$  is a **discrete probability distribution** if

- $\{s \in S \mid \mu(s) > 0\}$ , is finite (called the **support** of  $\mu$ ), and
- $\sum_{s \in S} \mu(s) = 1$

## Examples

- **Dirac distribution:**  $\mu_s^1 = \{s \rightarrow 1\}$
- **Product distribution:**  $(\mu_1 \times \mu_2)\langle s, t \rangle = \mu_1(s) \times \mu_2(t)$

$$\alpha : S \rightarrow (D(S) + 1)^N$$

Ex. 6.1: Formalise the systems below as functions

Notions of bisimulation arise naturally.

$$\alpha : S \rightarrow D((S \times N) + 1)$$

Before (reactive)

Ex. 6.2: Now (generative) – formalise it

## Probabilities in Uppaal

---

A1

A2

A3

$$\langle L, L_0, \text{Act}, C, \text{Tr}, \text{Inv} \rangle$$

where

- $L$  is a set of **locations**, and  $L_0 \subseteq L$  the set of **initial** locations
- $\text{Act}$  is a set of **actions** and  $C$  a set of **clocks**
- $\text{Tr} \subseteq L \times \mathcal{C}(C) \times \text{Act} \times \mathcal{P}(C) \times \mathbb{N} \times L$  is the **transition relation**

$$\ell_1 \xrightarrow{g, a, U, w} \ell_2$$

denotes a transition from location  $\ell_1$  to  $\ell_2$ , **labelled** by  $a$ , enabled if **guard**  $g$  is valid, which, when performed, **resets** the set  $U$  of **clocks**, **with a probability given by the weight**  $w$

- $\text{Inv} : L \longrightarrow \mathcal{C}(C) \cup \mathbb{Q}$  is the assignment of **invariants** or **rates** (of an **exponential distribution**) to locations

where  $\mathcal{C}(C)$  denotes the set of clock constraints over a set  $C$  of clock variables

## A1

- Probability of  $\langle A1_0, \bar{0} \rangle \xrightarrow{0.5} \langle A1_0, \bar{0.5} \rangle$ ?
- Probability of  $\langle A2_0, \bar{0} \rangle \xrightarrow{0.5} \langle A2_0, \bar{0.5} \rangle$ ?

## A2

## A3

## A1

## A2

## A3

- Probability of  $\langle A1_0, \bar{0} \rangle \xrightarrow{0.5} \langle A1_0, \bar{0.5} \rangle$ ?
- Probability of  $\langle A2_0, \bar{0} \rangle \xrightarrow{0.5} \langle A2_0, \bar{0.5} \rangle$ ?
- Probability of  $\langle A3_0, \bar{0} \rangle \xrightarrow{0.5} \langle A3_0, \bar{0.5} \rangle$ ?

## A1

## A2

## A3

- Probability of  $\langle A1_0, \bar{0} \rangle \xrightarrow{0.5} \langle A1_0, \bar{0.5} \rangle$ ?
- Probability of  $\langle A2_0, \bar{0} \rangle \xrightarrow{0.5} \langle A2_0, \bar{0.5} \rangle$ ?
- Probability of  $\langle A3_0, \bar{0} \rangle \xrightarrow{0.5} \langle A3_0, \bar{0.5} \rangle$ ?
- Probability of reaching  $A1_1$ ?
- Probability of reaching  $A2_1$ ?

## A1

## A2

## A3

- Probability of  $\langle A1_0, \bar{0} \rangle \xrightarrow{0.5} \langle A1_0, \bar{0.5} \rangle$ ?
  - Probability of  $\langle A2_0, \bar{0} \rangle \xrightarrow{0.5} \langle A2_0, \bar{0.5} \rangle$ ?
  - Probability of  $\langle A3_0, \bar{0} \rangle \xrightarrow{0.5} \langle A3_0, \bar{0.5} \rangle$ ?
  - Probability of reaching  $A1_1$ ?
  - Probability of reaching  $A2_1$ ?
  - Probability of reaching  $A3_{END}$  in less than 4.3?
- = ...

# A1: When does it end?

## A1

- Run 102000 times
- Histogram: how many times it took [9..9.1] seconds?
- ...

## A1's histogram

Parameters:  $\alpha=0.05$ ,  $\epsilon=0.05$ , bucket width=0.10002, bucket count=59  
Runs: 102000 in total, 102000 (100%) displayed, 0 (0%) remaining  
Span of displayed sample: [6.06618, 11.9675]  
Mean estimate of displayed sample:  $9.00732 \pm 0.00614869$  (95% CI)

### A2

- Run 100000 times
- Histogram: how many times it took [9..9.1] seconds?
- ...

### A2's histogram

## A3: When does it end?

- Run 300000 times
- Histogram: how many times it took [9..9.1] seconds?
- ...

### A3's histogram

Parameters:  $\alpha=0.05$ ,  $\epsilon=0.05$ , bucket width=0.19991, bucket count=100  
Runs: 300000 in total, 299181 (99.727%) displayed, 819 (0.273%) remaining  
Span of displayed sample: [0.0045298, 19.9958]  
Mean estimate of displayed sample:  $4.31514 \pm 0.0118734$  (95% CI)

$$\alpha : S \rightarrow D_{disc}((S \times N) + 1)$$

$$\alpha : S \rightarrow D_{cont}((S \times (N + \mathcal{R}_0^+) + 1))$$

## Before (PTS)

## Ex. 6.3: Now (Timed PTS) – formalise it

$$\alpha : S \rightarrow D_{disc}((S \times N) + 1)$$

$$\alpha : S \rightarrow D_{cont}((S \times (N + \mathcal{R}_0^+) + 1)$$

## Notes

- Continuous time: continuous distribution
- Probabilities both at continuous **delays** and discrete **transitions**.

## Ex. 6.4: Now (Timed PTS) – formalise it

## Probabilistic queries in Uppaal

---

- `Pr[c<=10; 100] ([] safe)` – runs 100 stochastic simulations and estimates the probability of safe remaining true within 10 cost units, based on 100 runs.
- `Pr[<=10] (<> good)` – runs a number of stochastic simulations and estimates the probability of good eventually becoming true within 10 time units. The number of runs is decided based on the probability interval precision ( $\pm\epsilon$ ) and confidence level (level of significance  $\alpha$ ).
- `Pr[<=10] (<> good) >= 0.5` – checks if the probability of reaching good within 10 time units is greater than 50% (less runs than calculating the probability, using “Walds’s algorithm”)
- `E[<=10; 100] (max: cost)` runs 100 stochastic simulations and estimates the maximal value of cost expression over 10 time units of stochastic simulation.

More at [https://docs.uppaal.org/language-reference/query-syntax/statistical\\_queries/](https://docs.uppaal.org/language-reference/query-syntax/statistical_queries/)

- `simulate[<=10] { x, y }` creates one stochastic simulation run of up to 10 time units in length and plot the values of `x` and `y` expressions over time (after checking, right-click the query and choose a plot).
- Variations: `[c<=10]` / `[#<=10]` – based on clock `c` or based on the number of transitions.

## A2

**Ex. 6.5:** Replicate the visualisation

**Ex. 6.6:** Replicate the visualisation also for A1 and A3

## A2's histogram

**Ex. 6.7:** Adapt the model to make it stochastic

**Ex. 6.8:** Adapt requirements to make them probabilistic

1. The lamp can become bright;
2. The lamp will eventually become bright;
3. The lamp can never be on for more than 3600s;
4. It is possible to never turn on the lamp;
5. Whenever the light is bright, the clock  $y$  is non-zero;
6. Whenever the light is bright, it will eventually become off.
